SUMMARY

Entry-level BI Developer trained in SQL Server, SSIS, SSRS, and Power BI through a hands-on apprenticeship program. Built a complete reporting pipeline end to end — raw source data through SSIS into a dimensional warehouse, served by both an SSRS paginated report and a Power BI dashboard. Looking to bring that same full-stack approach to a Junior BI Developer, SQL Developer, or Report Developer role.

SKILLS

- ETL Development (SSIS)
- Paginated Reporting (SSRS)
- T-SQL Querying & Database Design
- Dimensional Modeling & Data Warehousing
- Data Visualization & DAX (Power BI)
- Requirements Gathering & Stakeholder Communication

TRAINING

Lifting the Veil IT Academy — Apprenticeship Program

Jan 2026 – Jun 2026

Microsoft Data & BI Developer Track · Atlanta, GA

- Completed an intensive, project-based apprenticeship covering SQL Server database development, T-SQL, ETL development, paginated reporting, and business intelligence, using hands-on assignments built against a real relational database.
- Designed and queried SQL Server relational databases, including primary and foreign keys, constraints, table relationships, and views.
- Wrote T-SQL ranging from basic filtering and joins to advanced patterns — correlated and multi-value subqueries, Common Table Expressions (CTEs) including recursive CTEs, temporary tables, window and ranking functions (ROW_NUMBER, RANK, DENSE_RANK, NTILE, OVER/PARTITION BY), and UNION/UNION ALL set operations.
- Created and parameterized stored procedures to encapsulate reusable business logic and reporting queries.
- Applied database normalization (1NF–3NF) and dimensional modeling to design both transactional schemas and star-schema data warehouses with fact and dimension tables.
- Tuned T-SQL query performance by reading execution plans (scans vs. seeks), choosing clustered vs. nonclustered indexes, applying filtered indexes, and rewriting non-SARGable WHERE clauses.
- Designed and built SSIS ETL packages to extract data from flat files and relational sources, apply derived-column transformations and lookups, and load it into staging and warehouse tables.
- Implemented SSIS error handling and logging — error outputs on data flow components and logging providers — so pipeline failures are caught and recorded instead of failing silently.
- Built SSRS paginated reports with report and cascading/multi-value parameters, grouping and sorting, drilldown and drillthrough navigation, and data-driven subscriptions for scheduled delivery.
- Built Power BI data models and reports: Power Query transformations and data cleaning, DAX measures (including CALCULATE and filter context), KPIs, slicers, and drill-down/drill-through navigation.
- Practiced translating business requirements into database, ETL, and reporting designs, then documenting and presenting the finished solution to a non-technical audience.
- Used Git and GitHub for source control on SQL scripts, SSIS packages, and project documentation.
- Built a complete, end-to-end capstone project — raw source data through SQL Server and SSIS into a dimensional warehouse, served by both an SSRS paginated report and a Power BI dashboard — simulating the full scope of a Microsoft BI Developer role.

PROJECTS

Manufacturing Work Order Reporting Pipeline — Capstone Project

2026

Lifting the Veil IT Academy, Microsoft Data & BI Developer Apprenticeship Program

- Designed and built an SSIS ETL package to move manufacturing work order data from a SQL Server source

system into a staging and warehouse environment, eliminating manual CSV handoffs between production and reporting.

- Modeled an accumulating snapshot fact table (FactWorkOrder) with three role-playing date dimensions for order start, end, and due dates, enabling on-time-vs-late production reporting that didn't exist before.
- Built an SSRS paginated report (WorkOrderProductionSummary) with parameter-driven filtering by date range and product, giving production managers a self-service view instead of an ad hoc SQL request.
- Built a Power BI dashboard on the same warehouse tables surfacing scrap rate by product and location, identifying where quality issues concentrate.
- Documented the finished pipeline and set up a scheduled refresh so reports stay current without manual intervention.

EDUCATION

High School Diploma — Washington High School

Atlanta, GA · 2020
