SUMMARY

BI Developer with 3+ years of experience building and maintaining Microsoft BI solutions — SQL Server, SSIS, SSRS, and Power BI — and extending them with Power Automate to remove manual reporting and approval work. Comfortable owning a project from source system to finished dashboard, and increasingly the automation layer that keeps it running without someone babysitting it.

SKILLS

- | | |
|---|---|
| • ETL Development (SSIS) | • Dimensional Modeling & Data Warehousing |
| • Paginated Reporting (SSRS) | • Data Visualization & DAX (Power BI) |
| • T-SQL Querying & Database Design | • Business Process Automation (Power Automate, Dataverse) |
| • Approval Workflows & Notification Systems | • REST APIs, Custom Connectors & JSON |
| • Environment Strategy, DLP Policies & Application Lifecycle Management | • Requirements Gathering & Stakeholder Communication |

Tools: SSMS, SSDT/Visual Studio, Power BI Desktop & Service, Power Automate, Dataverse, SharePoint, Microsoft Teams, Outlook, Git

PROFESSIONAL EXPERIENCE

Build and maintain 11 production Power Automate flows covering scheduled reporting, approval routing, and data-quality monitoring across the BI team's reporting suite.

BI Developer (Promoted) — Oakmont Grocery

Aug 2028 – Present

Atlanta, GA

- Designed an approval workflow in Power Automate for late schema-change requests from source teams, routing each request to the data team lead before anything touches production ETL — replacing an informal, easy-to-miss email chain.
- Monitor dataflow refresh failures with a dedicated Power Automate trigger and branched notification logic, cutting the average time to catch a failed nightly refresh from “whenever someone notices a stale report” to under 15 minutes.
- Built a custom connector and a small Dataverse-backed intake app so non-technical stakeholders can submit new report requests without opening a ticket in the data team's queue.
- Repackaged the team's growing set of flows into solutions and set up a dev-to-test-to-production promotion path with environment variables and connection references, so a flow no longer has to be rebuilt by hand in each environment.
- Set a Data Loss Prevention policy separating business connectors (SharePoint, Outlook, Power BI) from non-business ones after a near-miss where a test flow combined SQL Server with a personal email connector.
- Secured flow-to-database connections with a dedicated service account and connection references instead of personal credentials, closing a gap flagged during an internal security review.
- Mentored two apprenticeship-program graduates joining the team, including walking them through the same manufacturing work order pipeline this role originally started from.

Associate BI Developer — Oakmont Grocery

Jul 2026 – Aug 2028

Atlanta, GA

- Took ownership of the end-to-end SQL Server !' SSIS !' dimensional warehouse !' SSRS/Power BI pipeline for the manufacturing and inventory reporting suite, extending it from a single capstone project into a production system supporting multiple business units.
- Replaced three manually distributed SSRS reports with a Power Automate scheduled flow that generates and emails parameter-driven report snapshots to regional managers every Monday morning, eliminating a recurring manual task.

- Built a Power BI data alert and a connected Power Automate flow that posts to Microsoft Teams when on-time production rate drops below a set threshold, so operations leads find out the same day instead of during a weekly review.
- Built a scheduled flow against SQL Server that flags rows failing basic data-quality checks (nulls in required fields, out-of-range dates) and routes them to a Teams channel before they reach the warehouse, instead of being caught downstream in a report.
- Split a sprawling single flow into smaller child flows for request validation, data lookup, and notification, making each piece independently testable and far easier to debug than the original monolithic version.
- Added an HTTP action to pull shipment status from a carrier's REST API and parse the JSON response into the warehouse's staging table overnight, replacing a manual status lookup someone had been doing by hand every morning.

Shift Lead — Oakmont Grocery

Jun 2021 – Jun 2026

Atlanta, GA

- Opened and closed the store independently, managing a team of 6–10 associates and daily cash reconciliation while completing the Lifting the Veil IT Academy apprenticeship part-time in the evenings.

SELECTED PROJECTS

Manufacturing Work Order Reporting Pipeline — Capstone Project

2026

Lifting the Veil IT Academy, Microsoft Data & BI Developer Apprenticeship Program

- Built the original end-to-end SQL Server/SSIS/SSRS/Power BI pipeline — including a FactWorkOrder accumulating snapshot fact table and a scrap-rate-by-location Power BI dashboard — that became the direct foundation for the production reporting system above.

TRAINING & CERTIFICATIONS

Lifting the Veil IT Academy — Apprenticeship Program

Jan 2026 – Jun 2026

Microsoft Data & BI Developer Track (Job Ready) + Power Automate Specialization (Advanced)

- Completed the full Microsoft BI stack plus a dedicated automation track covering flows, Dataverse, approval workflows, custom connectors, and governance (DLP policies, environment strategy, application lifecycle management).

Microsoft PL-300: Power BI Data Analyst

Exam scheduled

PROFESSIONAL DEVELOPMENT

Keep up with Power Platform release waves twice a year and bring relevant changes back to the team — most recently reviewing updates to dataflow refresh triggers and solution-aware environment variables.

EDUCATION

High School Diploma — Washington High School

Atlanta, GA · 2020
